

ASTM D-1894

Static and Kinetic Coefficients of Friction of Plastic Film and Sheeting

This test method covers the determination of the coefficients of starting and sliding friction of plastic film and sheeting when sliding over itself or other substances at specified test conditions. The coefficients of friction are related to the slip properties of plastic films that are of wide interest in packaging applications. These methods yield empirical data for control purposes in film production. Correlation of test results with actual performance can usually be established. Data obtained by these procedures may be extremely sensitive to the age of the film or sheet and the condition of the surfaces.
